

Prescription Renewals the Way They Should Be—Easy and Efficient

SmartRenewal™ Reduces Redundant Tasks for Busy Clinicians and Saves Them Time for Providing Care

The Challenges of Consolidating Data From Separate Systems

What if the providers at your ambulatory practices could safely confirm and renew prescriptions with fewer clicks and keystrokes? You'd have more efficient workflows, fewer medication errors, and improved patient safety. You'd also have happier clinicians who spend less time on data entry and more time caring for patients.

A new electronic health record (EHR) integration for Epic™ and MEDITECH™ improves the prescription renewal workflow by safely adding missing medication details with patented artificial intelligence. Instead of standard sig mapping tables that need to be maintained, AI prepopulates all discrete fields with consistent terms that your organization uses. After implementing SmartRenewal, one health system found that 84% of prescription data either partially or fully populated in the EHR. Prescription renewals are now just as they should be—easy and efficient.

EHR Workflow Enhancements Support Care Teams and Patients

Improving the renewal request process is just one aspect of our Medication Management Suite. DrFirst also helps health systems:

- Reduce manual entry and errors associated with medication reconciliation
- Improve medication adherence with in-workflow prescription drug price transparency
- Send automated text messages so patients can learn about their medications, save money with coupons, and schedule pickup reminders with their pharmacy

A recent survey found 86% of our customers have improved their ability to reduce adverse drug events (ADEs) and monitor patient medication adherence so they can intervene when necessary.

Schedule time with your account manager or sales partner to see how EHR enhancements from DrFirst can help streamline prescription renewals, improve your patients' medication adherence, and ultimately reduce readmissions.

After implementing **SmartRenewal**, one health system found that **84% of prescription data** either partially or **fully populated** in the EHR.
